Update Moonflower's Coffee to jQuery

Getting Started

You should download and open the sample application project folder in an IDE. The application is available on D2L as the session5.zip file.

Include jQuery using a CDN

In the index.html file, add the script tag as follows:

```
<script src="https://code.jquery.com/jquery-2.1.4.js"></script>
```

Move code into jQuery ready

Wrap the code that "just runs" with the jQuery $(document).ready function.

```
$(document).ready( function() {
    ...
} );
```

Note that you can still put this in your IIFE. You don't always want everything inside of the ready function, but for this example, that is fine.

Use jQuery functions for DOM Manipulation

Replace the use of document.getElementById with the jQuery function. Use jQuery functions for things like the JavaScript `nextElementSibling`, `getAttribute()`, `setAttribute()`, etc.
